w3c-validation

linter-htmlhint

linter-stylelint

Cross-Platform tested [See Screenshots]

When running HTML code with W3C Validator some errors were shown.

While I could solve some, some others got complicated.

After trying I stopped since it was messing with my code (which was working fine and showing everything properly until I ran and corrected with W3C).

For example:

- the visualization of my LinkedIn logo and link disappeared after correcting the mistake that the validator showed. But then while entering them on different Browsers, the logo does appear.
- some `<p>` or `<br>` not being "valid" to create new paragraphs
- some closed or unclosed elements
